Assignment Project Exam Help Bayesian Methods https://powcoder.com

Add WeChat powcoder Motivation

Problem With Waximum Likelihood: Add WeChappowcoder

- ML estimates are biased
- Especially a problem for small number of samples, or high input dimensionalityment Project Exam Help
- Suppose we sample 2,3,6 points from the same dataset, use ML to fit regression parameters der.com

Problem With Waximum Likelihood: Add Wesherpewegler

 $h(x, \theta_{ML})$

X

 \mathcal{X}

- ML estimates cannot be used to choose complexity of model
 - E.g. supposeigrament to restimate am Help the number of basis functions
 - Choose K=1? https://powcoder.com
 - Or K=15? Add WeChat powcoder
 - ML will always choose K that best fits training data (in this case, K=15)
 - Solution: use a Bayesian method--define a prior distribution over the parameters (results in regularization)

Assignment Project Exam Help Bayesian Frequentist

Frequentist: maximize data likelihood

Bayesian: treat θ as tapes of power in the posterior

$$p(\theta|D) = \frac{\text{Mod We follows oder}}{p(D)}$$

 $p(D|\theta)$ is the data likelihood, $p(\theta)$ is the prior over the model parameters

Assignment Project Exam Help Rawesian Method

Treat θ as random variable, maximize posterior

$$p(\theta|D) = \frac{p(D|\theta)p(\theta)}{\text{Proje(Ot)}}$$
Assignment Proje(Ot)Exam Help

Likelihood $p(D|\theta)$ is the same we before, as in Maximum Likelihood Add We Chat powcoder

Prior $p(\theta)$ is a new distribution we model; specifies which parameters are more likely *a priori*, before seeing any data

p(D) does not depend on θ , constant when choosing θ with the highest posterior probability

Assignment Project Exam Help Bayesian Linear Regression

Let's now apply the Bayesian method to linear regression.

To do that, we Assigned pto langue the Essama Incom variable, design a prior over it. https://powcoder.com

First, review maximanddikelie Control of the contro

Probability of one datatpoint/powcoder.com

$$p(t|x,\theta,\beta) = N(t|h(x),\beta^{-1})$$

Add WeChat powcoder

$$p(t|x,\theta,\beta) = \prod_{i=1}^{m} N(t^{(i)}|h(x^{(i)}), \beta^{-1})$$
 Likelihood function

Maximum likelihood solution

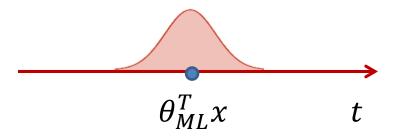

$$\theta_{ML} = \underset{\theta}{\operatorname{argmax}} p(t|x, \theta, \beta)$$
 $\beta_{ML} = \underset{\beta}{\operatorname{argmax}} p(t|x, \theta, \beta)$

Assignment Project Exam Help What is Buseful for?

- Recall: we assumed observations t are Gaussian given h(x)
- β allows us to write down distribution over t, given new x, called predictive distribution of Exam Help

https://powcoder.com

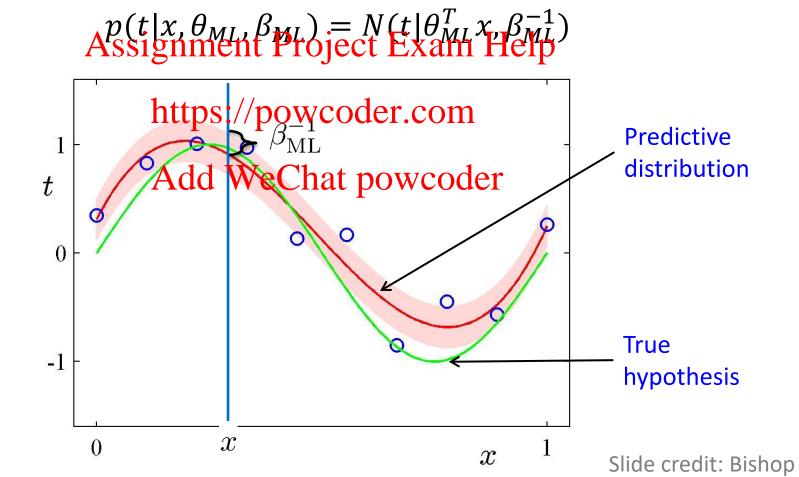

Add Weckfar you wooder

 β_{ML}^{-1} is the variance of this distribution

Predictive Distribution

Given a new input point x, we can now compute a distribution over the output t:

Define a distribution over parameters

• Define prior distribution over θ as

$$p(\theta) = N(\theta | m_0, S_0)$$

Assignment Project Exam Help

 Combining this with the likelihood function and using results for marginal and topditional condense and the posterior

Add WeChat powcoder
$$p(\boldsymbol{\theta}|\boldsymbol{t}) = N(\boldsymbol{\theta}|\boldsymbol{m}_N, \boldsymbol{S}_N)$$

where

$$\boldsymbol{m}_{N} = \boldsymbol{S}_{N}(\boldsymbol{S}_{0}^{-1}\boldsymbol{m}_{0} + \beta \boldsymbol{X}^{T}\boldsymbol{t})$$
$$\boldsymbol{S}_{N}^{-1} = \boldsymbol{S}_{0}^{-1} + \beta \boldsymbol{X}^{T}\boldsymbol{X}$$

A common choice for prior

A common choice for the prior is

 $p(\boldsymbol{\theta}) = N(\boldsymbol{\theta}|\boldsymbol{\theta}, \alpha^{-1}\boldsymbol{I})$ Assignment Project Exam Helpo

for which

https://powcoder.com

$$m_N = \beta S_N X^T t$$

Add WeChat powcoder
 $S_N^{-1} = \alpha I + \beta X^T X$

Assignment Project Exam Help Intuition: prefer θ to be simple Add WeChat powcoder

For a linear model for regression, $\theta^T x$ θ_1 What do we mean by θ being simple?

Assignment Project Exam Help $p(\theta) = N(\theta | \mathbf{0}, \alpha^{-1} \mathbf{I})$ https://powcoder.com

Namely, put a prior And θ , Which cappures could be lief that θ is around zero, i.e., resulting in a simple model for prediction.

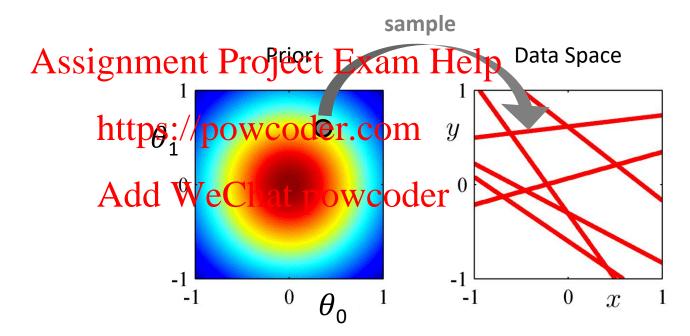

This Bayesian way of thinking is to regard θ as a random variable, and we will use the observed data D to update our prior belief on θ

Add WeChat powcoder Connection to Regularized Linear Regression

Maximizing posterior leads to regularized Add Weshat pawgoder

Joint likelihood of both training data and parameter

$$\begin{split} \log p(\mathcal{D},\theta \) &= \sum \log p(y_n|\boldsymbol{x}_n,\theta \) + \log p(\theta \) \\ &\quad \text{Assignment Project Exam Help} \\ &\quad \frac{\sum_n (\theta^{\text{T}}\boldsymbol{x}_n - y_n)^2}{\text{https://powgoder.com}} \sum_d \frac{1}{2\alpha^{-2}} \, \theta_d^2 + \text{const} \end{split}$$

where β^{-2} is the noise Adahce and that is the properties of the properties of

Maximum a posterior (MAP) estimate: we seek to maximize

$$\theta_{MAP} = \operatorname{arg\,max}_{\theta} \log p(\theta \mid \mathcal{D}) \propto \log p(\mathcal{D}, \theta)$$

that is, the most likely θ conditioning on observed training data \mathcal{D} .

Maximatignesterier feads Helpregularized Add Westatun stioner

Can re-write the optimization in the same form as the **regularized linear regression** cost:

$$Assignment Project Exam Help$$

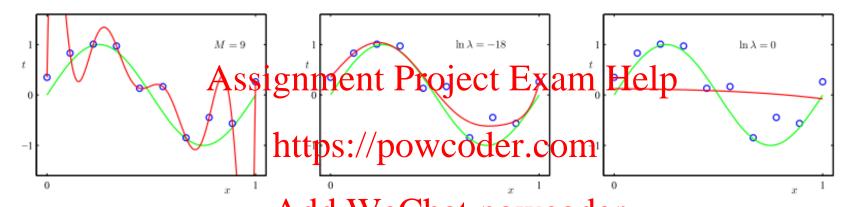

where $\lambda = \beta^{-2}/\alpha^{-2}$ corresponds to the regularization hyperparameter. https://powcoder.com

- Intuitively, as $\lambda \to A + \infty$, then $\beta^{-2} \to \alpha^{-2}$. That is, the variance of noise if far greater than what our prior model can allow for θ . In this case, our prior would be more accurate than what data can tell us, so we are getting a simple model, where $\theta_{MAP} \to 0$.
- If $\lambda \to 0$, then $\beta^{-2} \ll \alpha^{-2}$, and we trust our data more, so the MAP solution approaches the maximum likelihood solution, i.e. $\theta_{MAP} \to \theta_{ML}$.
